

CDD: Battery Human

Game Title: Battery Human

Genre: Multiplayer survival/horror

Platform: PC

Target Audience: Teens and young adults who enjoy co-op horror, chase games, betrayal mechanics, and Roblox-inspired escape games

Document Version: v1.0

Author: Ihita Pillutla

Date: 16/5/26

1. High Concept Overview

Battery Human is a multiplayer facility escape horror game based on the topic “The Player is the Resource.” A group of players wake up inside a research facility where every system is powered by human energy. Doors, terminals, generators, rescue pods, and the final exit do not use fuel or coins. They use the players themselves.

Players must work together to escape, but each objective drains a part of them: stamina, warmth, memory, voice, or identity. The team can split the cost fairly, or one player can force another player to pay. This creates a tense co-op experience where teamwork, betrayal, sacrifice, and survival all exist at the same time.

The game is inspired by the escape tension and facility structure of “Flee the Facility”, but changes the main idea by making the humans themselves the energy source. The match becomes harder as players progress because the facility becomes more aware and starts demanding more from them - like an adaptive environment.

2. Game pillars/Design goals

- The Player Is the Resource: The central mechanic is that the player’s body, mind, and identity are used as fuel for progression.
- Cooperation With Pressure: Players need each other to escape, but helping others costs something personal.
- Difficulty Escalates With Progress: Every completed objective increases Drain Intensity, making the facility more dangerous and more demanding.
- Betrayal Is Possible, Not Required: The game allows selfish choices, but the strongest endings reward smart teamwork.
- Psychological Horror Over Jumpscare: The horror comes from being consumed, forgotten, and used by the facility.

- Replayable Multiplayer: Different teams, decisions, sacrifices, betrayals, and escape routes create different match outcomes.

3. Target Audience

Battery Human is aimed at players aged 13-18+ who enjoy fast multiplayer tension, escape-room objectives, horror ambience, and player-driven chaos. It is especially suitable for students and young players familiar with Roblox horror games, co-op survival games, and games where trust can break under pressure.

The game is designed to be easy to understand but emotionally intense. Players should quickly understand the objective: power the facility systems and escape. The deeper hook is that every objective has a personal cost.

4. Genre + Platform

- Genre: Multiplayer facility escape horror with survival resource-management mechanics.
- Platform: PC as the main platform. A Roblox-style prototype or simplified online version could be considered later, but the core CDD assumes PC development.
- Match Format: 4-6 human players versus an AI-controlled bot: "The Warden". A player-controlled Warden mode can be added as a future expansion.
- Perspective: 3D - This keeps the scope manageable while still allowing facility rooms, chase paths, terminals, rescue pods, and exit gates.

5. Core gameplay loop

1. Players spawn inside a locked facility with limited human resources.
2. The team explores rooms to find terminals, generators, locked doors, and rescue pods.
3. Players avoid the Warden/Warden while completing objectives.
4. Each objective requires human charge, paid through stamina, warmth, memory, voice, or identity.
5. Players decide whether to split costs fairly, sacrifice themselves, or push costs onto others.
6. Completed objectives increase Drain Intensity, making the next phase harder.
7. The team opens the final exit, escapes together, betrays each other, or gets fully drained.

The loop is pretty simple, but every round becomes different because players negotiate, panic, rescue, refuse, betray, or sacrifice based on the situation.

6. Mechanics overview

- **Human Resource System:**

Resource	Used for	Consequence when its low
----------	----------	--------------------------

Stamina	Running, forcing doors, carrying teammates, and emergency movement.	Low stamina slows movement and makes chases harder.
Voice	Call teammates, ping locations, distract the Warden, and activate voice locks.	Low voice limits communication tools and warning calls.
Memory	Hacking terminals, solving code locks, and reading facility clues.	Low memory scrambles UI hints, maps, and terminal text.
Warmth	Power generators, thaw rescue pods, and stabilize teammates + heal teammates.	Low warmth causes slower recovery and colder visuals.
Identity	Final exit systems, bypassing scanners, and high-level overrides.	Low identity makes the facility stop recognizing the player as fully human.

- **Objective Types:**

Objective	Function
Terminals	Players hack terminals to unlock facility systems. Hacking costs Memory and becomes slower as Drain Intensity rises.
Generators	Generators power doors and exit systems. Activating them costs Warmth or shared Human Charge.
Heavy Doors	Doors can be forced open using Stamina, but doing so weakens the player during chases.
Rescue Pods	Captured players are placed into pods that slowly drain them. Rescuing them costs Warmth or Stamina.
Voice Locks	Some doors require a player to spend Voice to activate a command system.
Identity Gate	The final exit requires Identity. This makes the endgame emotionally and mechanically risky.

- **Shared Sacrifice System:**

Some machines require a group payment. Instead of one player paying the full cost, the team can split the drain. For example, an exit generator may require 100 Human Charge. One player may give 25 Warmth, another may give 20 Stamina, another may give 30 Memory, and another may refuse to contribute. This creates teamwork and conflict.

This system directly supports the theme because the “economy” of the game is the players. The team must decide how much each person is worth and who deserves to survive.

- **Betrayal and Forced Drain System:**

Certain emergency overrides allow players to redirect costs. This is useful in panic situations, but morally dangerous. For example, a player can open a shortcut instantly, but the facility drains the nearest teammate instead. This creates social tension without making betrayal the only way to win. Betrayal is balanced by consequences. A selfish player may survive short-term but lose trust, become isolated, or trigger worse endings.

- **Warden System:**

The Warden is an AI-controlled facility guardian. It patrols rooms, follows noise, reacts to powered machines, and captures players. Captured players are placed in Drain Pods, where their resources decrease until teammates rescue them. As the **Drain Intensity** increases, the Warden becomes faster, patrols closer to objectives, and reacts more aggressively to terminal activity.

- **DRAIN INTENSITY (SIDEQUEST) System:**

The game gets harder as the player progresses. The facility has a **Drain Intensity meter** that increases every time players complete an objective. Progress is useful, but it also wakes the facility up.

DIFFICULTY PHASE	EFFECT ON GAMEPLAY
PHASE 1: Low	The facility is waking up. Machines cost small amounts of resources, the Warden is slower, and rescues are easier.
PHASE 2: Rising	The facility detects resistance. Terminals take longer, doors cost more, and some machines require two players.
PHASE 3: Lockdown	Lights flicker, random rooms lock, rescue pods drain faster, and the Warden patrols near objectives.
PHASE 4: Consumption	The final exit requires a large shared sacrifice. Low-resource players are weak, betrayal becomes tempting, and the Warden

	guards the escape route.
--	--------------------------

- This creates a clear match arc: early game is exploration, mid game is coordination, late game is desperation. The difficulty rises through stronger enemies, higher resource costs, shorter rescue windows, restricted movement, and harder team decisions.

7. Theme, Settings + Aesthetics

- Theme: The main theme is exploitation. The player is not collecting resources. The player is the resource. Battery Human turns survival into a question of cost: who pays, who benefits, and what remains after escape? The game also explores teamwork under pressure. It asks whether people cooperate when sacrifice is fair, or become selfish when survival becomes expensive.
- Settings: The game takes place in a human-energy research facility built to run on emotion, body heat, memory, voice, and identity. The facility looks abandoned, but it is alive through its systems. It does not hate the players. It simply sees them as batteries.
 1. Spawn Ward: tutorial area and starting room
 2. Terminal Wing: hacking and memory-based objectives
 3. Cold Generator Hall: warmth-draining generator puzzles
 4. Drain Pod Chamber: captured players are held and drained
 5. Identity Gate: final escape area and highest-cost objective
- Aesthetics: The visual style should be dark, clinical, and slightly futuristic. The facility uses cold colors, metal walls, warning lights, glass pods, wires, and glowing machines. The players begin with warm visual accents, but their colors dim as they lose resources.
 1. Low Warmth: colder screen tint and visible breath
 2. Low Memory: distorted map labels and glitching text
 3. Low Voice: muted communication icons and broken speech bubbles
 4. Low Identity: player name flickers or disappears
- Sound: Sound should support the increasing difficulty. Early match ambience is quiet, with distant humming and footsteps. As Drain Intensity rises, alarms, machine pulses, breathing, heartbeat sounds, and Hunter audio become louder and more aggressive.
 1. Low Warmth: heartbeat slows and ambience becomes colder
 2. Low Memory: music loops incorrectly or stutters
 3. Low Voice: teammate calls become muffled
 4. High Drain Intensity: alarm layers, machine growls, and lockdown sirens build pressure

8. Progression + Replayability

Progression happens inside each match and across replayed matches. Inside a match, players progress by completing objectives and moving closer to the final exit. However, each completed objective increases Drain Intensity, so the game becomes harder as the team gets closer to winning.

- In-match progression:

1. Start with simple objectives and low drain costs
 2. Complete terminals and generators to unlock exit systems
 3. Increase Drain Intensity after every major objective
 4. Face harder chases, higher costs, faster pod drain, and locked rooms
 5. Reach a final exit that requires shared sacrifice
- Replayability: Replayability comes from multiplayer decisions. Even with the same map, every match changes depending on who contributes, who panics, who rescues, who betrays, and which resources get overused.
 1. Different team behavior every match
 2. Multiple resource sacrifice strategies
 3. Randomized terminal and generator locations
 4. Different Hunter patrol routes
 5. Different endings based on team survival and sacrifice patterns
 - Possible Endings/Match Results

ENDING	CONDITION/CAUSE
Team Escape	Most players escape because the team shares resource costs fairly.
Solo Escape	One player escapes after others are captured or drained.
Betrayal Escape	A player escapes by forcing others to pay the final cost.
Everyone Drained	The facility consumes all players before the exit opens.
System Shutdown	The team completes hidden objectives and destroys the facility instead of only escaping.

9. Emotional/Player exp goals

- Battery Human should feel tense, chaotic, unfair, funny in a dark way, and emotionally uncomfortable. The player should feel the pressure of being chased, but also the pressure of being needed by the team. The emotional hook is that progress is never free. Every objective should make players ask: "Do I pay? Do we split it? Or do I make someone else pay?"
 1. Fear when The Warden gets close

2. Guilt when another player pays too much
 3. Suspicion when someone refuses to contribute
 4. Panic when Drain Intensity reaches lockdown
 5. Relief when the team escapes together
 6. Shock when betrayal opens the exit
- The game should create a mix of co-op teamwork and social tension. Players should laugh, panic, yell at each other, rescue each other, and question each other's choices.

10. Competitive Analysis

GAME NAME	INSPIRATION ELEMENT	HOW BATTERY HUMAN IS DIFFERENT
Flee the Facility	Facility escape structure, terminal objectives, chase pressure, and rescue tension.	The players themselves the resource, adds shared sacrifice, escalating drain, and psychological consequences.
Among Us	Social distrust, arguing, and suspicion between players.	Creates betrayal through resource drain rather than hidden impostors.
Dead by Daylight	Multiplayer escape pressure and hunter-survivor tension.	Smaller-scope and focuses on resource cost instead of combat/perks.
Papers, Please	Moral pressure through simple choices.	Applies moral pressure to multiplayer survival instead of document checking.
INSIDE	Cold facility atmosphere and environmental horror.	Adds multiplayer chaos and direct sacrifice mechanics.

11. Scope + Feasibility

Estimated Development Time: 6-8 months

Estimated Team Size: 5-7 developers

- Required Roles:
 1. 1 Game Designer
 2. 1 Narrative Designer
 3. 2 Artists (Player skin + custom player skin elements + environments)

4. 1 Programmer (mechanics + systems)
5. 1 Sound Designer/Composer
6. 1 QA Tester

Asset scope is controlled through:

- Low poly based assets
- Limited map regions
- Reusable environment assets

Overall Complexity: Medium

Feasible for indie or student-level production.

12. Future expansion

- Player-Controlled Warden Mode: One player becomes the Warden, making the game closer to asymmetric multiplayer horror.
- More Maps: New facility wings/locations
- Character Classes: Optional roles like Runner, Technician, Medic, and Anchor with different resource strengths.
- Cosmetic Progression: Unlockable suits, glow colors, emotes, pod designs, and badges without affecting fairness.
- Advanced Betrayal Tools: More emergency overrides, fake objectives, and hidden sacrifice routes.
- Roblox Prototype: A simplified version could be tested in Roblox because the inspiration and audience fit well.
- Story Mode: A smaller single-player/co-op narrative mode explaining how the facility was created.
