

GDD: Battery Human

1. Overview

Game Name: Battery Human

Theme/Prompt: "The player is the resource"

Genre: Survival/Horror

Player: Multiplayer, 4-6 players

Platform: PC

Technical Form: 3D: Multiplayer escape game with interactive machines, terminals, chase sequences, rescue systems, and resource-based choices

View: First-person perspective

Language/Engine: Unity using C#

Battery Human is a multiplayer facility escape horror game where players wake up inside a machine-run research facility that uses human beings as fuel. The players are not collecting resources from the world. They are the resources. Every door, terminal, generator, rescue pod, and exit system requires human energy to activate. Players must spend parts of themselves such as Stamina, Warmth, Memory, Voice, and Identity to progress. These resources are not just numbers. They affect movement, communication, vision, dialogue, map awareness, and the final outcome of the match.

A group of players must work together to escape the facility while avoiding the Warden, a dangerous hunter created by the facility to capture and drain test subjects. Captured players are placed inside Drain Pods, where their human energy slowly powers the building. Teammates can rescue them, but rescue also costs resources. The game is inspired by facility escape games such as Flee the Facility, especially in its use of terminals, escape pressure, rescue moments, and being hunted inside a closed environment. However, Battery Human changes the core idea by making the players themselves the fuel. The main question of the game is:

If the facility needs a battery, who will you let it use? The game becomes harder as players progress. As objectives are completed, the facility becomes more aware and hungrier. Machines demand higher human-resource costs, the Warden becomes more aggressive, rescue timers shorten, rooms lock down, and the final exit requires a major shared sacrifice.

The difficulty increases because progress makes the facility hungrier.

2. Experience

Battery Human should feel tense, chaotic, scary, strategic, and socially stressful. The player should feel the pressure of trying to survive while also depending on teammates who may or may not protect them. The horror is not only being chased. The horror is realizing that the team needs someone to pay the cost.

Players are surrounded by cold machines, locked doors, flickering lights, broken terminals, and human-powered systems. Every important interaction asks for a resource. The facility does not ask for coins, keys, batteries, or fuel cans. It asks for the player.

The player should constantly wonder:

“Should I spend my stamina now or save it for a chase?”

“Should I give memory to finish this terminal?”

“Why is my teammate not helping with the cost?”

“If I rescue them, will I have enough warmth left?”

“Can I trust this player near the exit?”

“Do we all escape, or does someone become the battery?”

“What happens if I force someone else to pay?”

The emotional experience is built around survival, trust, sacrifice, betrayal, panic, and teamwork. The game should make players laugh, scream, argue, negotiate, and make desperate decisions under pressure.

A good match should feel like a social horror story. First, everyone wants to cooperate. As resources drop and the facility becomes harder, players begin to panic. Some players may sacrifice themselves to help the group. Some may betray others to escape. Some may become too drained to survive. The match should create memorable moments where players say:

“I saved you, so you owe me.”

“Someone has to power the gate.”

“Why did you leave me in the pod?”

“You used me as a battery :(”

The game should become more intense over time. Early gameplay should feel manageable. Mid-game should require teamwork. Late-game should feel desperate, loud, unstable, and morally uncomfortable.

3. Mechanics

Core Gameplay Loop

The players wake up in different parts of the facility. They must explore rooms, avoid the Warden, activate machines, rescue captured teammates, and escape through the final exit.

Each match follows this loop:

1. Players search rooms for terminals, generators, locked doors, and rescue stations.
2. Players use their own human resources to activate objectives.
3. The Warden hunts, captures, and places players into Drain Pods.
4. Teammates decide whether to spend resources to rescue captured players.
5. Completed objectives increase facility awareness and difficulty.
6. Players reach the exit phase.
7. The final escape requires a shared human-resource sacrifice.
8. Players escape together, escape alone, betray others, or get consumed by the facility.

The basic player actions are:

- Run
- Hide
- Interact
- Hack terminals
- Power machines
- Rescue teammates
- Share resources
- Refuse to contribute
- Force emergency overrides
- Escape through exit gates

The core tension is that almost every useful action costs something.

Main Mechanic: Human Charge System

Human Charge is the main resource concept of Battery Human. Instead of collecting fuel, the player's body and mind act as the fuel source.

Each player has five human resources:

- Stamina
- Warmth
- Memory
- Voice
- Identity

These resources are used to activate machines and survive the match. They also affect the player's condition.

- Stamina: Stamina represents physical energy. It is used for running, climbing, forcing doors open, escaping grabs, and carrying weakened teammates.
- Stamina decreases when the player:
 1. sprints for too long
 2. opens heavy doors
 3. escapes the Warden's grip
 4. carries another player
 5. powers physical machinery
 6. performs emergency movement actions
- If Stamina becomes low:
 1. the player runs slower
 2. escape actions take longer
 3. the player cannot force doors open
 4. the Warden catches them more easily
- Warmth: Warmth represents body heat and emotional life. It is used to power frozen machines, revive teammates, survive cold rooms, and stabilize drained players.
- Warmth decreases when the player:
 1. stays inside cold rooms
 2. powers heat-based machines
 3. rescues a teammate from a Drain Pod
 4. shares warmth with a dying player
 5. activates safe zones
- If Warmth becomes low:
 1. the screen becomes colder and paler
 2. movement becomes stiff
 3. breathing becomes weaker
 4. the player becomes easier for sensors to detect

- Memory: Memory represents the player's ability to remember routes, codes, teammate locations, and facility information. It is used for hacking terminals and decoding locked systems.
- Memory decreases when the player:
 1. hacks terminals
 2. reads corrupted facility files
 3. solves memory locks
 4. accesses hidden routes
 5. uses map-reveal systems
- If Memory becomes low:
 1. the map becomes incomplete
 2. objective markers disappear
 3. terminal prompts become distorted
 4. room names vanish
 5. the player may forget teammate locations
- Voice: Voice represents communication and social presence. It is used to call for help, distract the Warden, activate voice locks, ping teammates, and trigger alarms.
- Voice decreases when the player:
 1. shouts to distract the Warden
 2. calls for rescue while captured
 3. activates voice-controlled doors
 4. sends team-wide alerts
 5. uses command-based machines
- If Voice becomes low:
 1. the player cannot call for help clearly
 2. pings become weaker
 3. some dialogue or chat signals are blocked
 4. rescue calls become harder for teammates to detect
- Identity: Identity represents the player's name, humanity, and recognition by the facility. It is the most dangerous resource to lose.
- Identity decreases when the player:
 1. uses emergency override systems
 2. bypasses identity scanners
 3. transfers costs to another player
 4. activates the final exit
 5. sacrifices themselves for the team
 6. betrays another player too often
- If Identity becomes low:
 1. the player's name begins to glitch
 2. the facility stops recognizing them as human
 3. their sprite becomes less detailed
 4. teammates see corrupted player labels

5. the player risks becoming a permanent battery

The Human Charge System makes every action meaningful. A player can help the team, but helping always costs something.

[SIDEQUEST] Secondary Mechanic: Drain Intensity System

The Drain Intensity System controls how the game gets harder as players progress. The facility becomes more dangerous every time players complete objectives. It learns from the players and increases the cost of escape. The more progress players make, the hungrier the facility becomes.

Drain Intensity has four phases:

Phase 1: Low Drain

The facility is waking up.

1. Machine costs are low.
2. The Warden moves slowly.
3. Terminals are simple.
4. Rescue pods drain players slowly.
5. Most doors can be opened by one player.

Phase 2: Rising Drain

The facility realizes the players are trying to escape.

1. Machine costs increase.
2. Hacking takes longer.
3. Some objectives require two players.
4. The Warden patrols more aggressively.
5. Captured players lose resources faster.

Phase 3: Emergency Lockdown

The facility begins actively fighting back.

1. Random rooms lock temporarily.
2. Lights flicker and visibility drops.
3. Some routes become blocked.
4. Rescue pods drain faster.

5. The Warden gains faster chase speed.
6. Machines begin demanding specific resource types.

Phase 4: Full Consumption

The final escape phase begins.

1. The exit gate requires a huge shared sacrifice.
2. One player cannot open the exit alone.
3. The Warden patrols near exits.
4. Low-resource players become slower and more vulnerable.
5. Emergency override options appear, allowing players to force costs onto teammates.

This system ensures that the game does not stay the same from beginning to end. The match becomes more difficult because progress itself makes the facility stronger.

The difficulty increases because progress makes the facility hungrier.

Tertiary Mechanic: Shared Sacrifice System

Some objectives require a shared resource payment from multiple players. These machines cannot be activated by one person alone unless that player sacrifices a dangerous amount of themselves.

For example:

Exit Gate Requirement: 100 Human Charge

- Player A contributes 25 Stamina.
- Player B contributes 20 Warmth.
- Player C contributes 30 Memory.
- Player D refuses to contribute.
- Player E contributes 25 Identity.

The machine activates only after the total cost is paid.

This creates multiplayer tension because players must negotiate who pays and how much. A selfish player may save their resources while others weaken themselves. A heroic player may sacrifice too much and risk not surviving the escape.

Quaternary Mechanic: Capture and Rescue System

The Warden can capture players and place them inside Drain Pods. A captured player slowly loses Human Charge while trapped.

Captured players can:

- call for help if they still have Voice
- struggle if they still have Stamina
- ping their location if they still have Memory
- resist freezing if they still have Warmth
- stay human if they still have Identity

Teammates can rescue captured players by reaching the pod and spending resources to open it.

Rescue cost example:

Open Drain Pod: 15 Warmth + 10 Stamina

Emergency Rescue: 20 Identity

Silent Rescue: 15 Voice

The rescue system creates emotional choices. Saving a teammate is good, but it weakens the rescuer. Leaving a teammate behind helps the remaining players survive, but it can lead to betrayal endings and lower team scores.

Quinary Mechanic: Betrayal/Emergency Override System

The facility offers shortcuts called Emergency Overrides. These allow players to progress quickly, but the cost is cruel.

Examples:

- Open a door instantly, but drain the nearest teammate's Warmth.
- Escape a chase, but reduce another player's Stamina.
- Reveal the exit, but erase part of a teammate's Memory.
- Activate the gate alone, but transfer the Identity cost to another player.

These options are risky because they can help a player survive but damage team trust. Betrayal can lead to solo escape endings, but it can also make the betrayer a target for other players.

Senary Mechanic: Betrayal/Emergency Override System

The Warden is the facility's hunter. It exists to stop players from escaping and return them to the power system.

The Warden behavior changes based on Drain Intensity.

At low Drain Intensity:

- the Warden patrols slowly
- reacts to loud sounds
- follows basic routes

At medium Drain Intensity:

- the Warden hears failed terminal hacks
- checks common hiding areas
- chases longer

At high Drain Intensity:

- the Warden predicts player routes
- guards rescue pods
- patrols exit gates
- becomes faster near powered machines

The Warden can be AI-controlled for the main version. A future expansion can allow one player to control the Warden.

4. Systems

Human Resource System

Every player has five resource meters:

- Stamina
- Warmth
- Memory
- Voice
- Identity

These resources act as health, currency, ability fuel, and narrative condition at the same time. The player spends them to interact with the facility and loses them when damaged, captured, or drained. The system should make the player feel like their character is slowly being consumed.

Choice Consequences System

Every major interaction affects at least one human resource.

Example:

- Choice: Hack terminal normally
- Effect: -10 Memory
- Reward: Objective progress increases

- Choice: Force open heavy door
- Effect: -15 Stamina
- Reward: New route opens

- Choice: Rescue teammate
- Effect: -10 Warmth, -10 Stamina
- Reward: Teammate returns to play

- Choice: Call loudly for help
- Effect: -10 Voice
- Reward: Teammates see location
- Risk: Warden may hear

- Choice: Emergency override
- Effect: -20 Identity or transfer cost to another player
- Reward: Instant machine activation
- Risk: Betrayal penalty
-

This creates tension because the most helpful option may weaken the player, while the fastest option may harm someone else.

Objective System

Players must complete a set number of facility objectives before the exit gate activates.

Objectives include:

- powering generators
- hacking memory terminals
- opening sealed routes
- restoring emergency systems
- rescuing captured players
- collecting facility access codes
- activating the final exit gate

Each objective increases Drain Intensity. The closer the team gets to escape, the harder the facility becomes.

Terminal System

Terminals are important interactive machines that help unlock the exit. They require Memory to use.

Terminal interactions include:

- timing-based inputs
- symbol matching
- corrupted text puzzles
- short cooperative hacking sequences
- risk of failed hacks making noise

If the player's Memory is high, terminals are readable and easier to complete. If Memory is low, terminal text glitches, symbols rearrange, and the player may need help from teammates.

Door and Machine System

Doors and machines require different human resources.

Examples:

- Heavy Door: costs Stamina
- Frozen Door: costs Warmth
- Voice Lock: costs Voice
- Memory Terminal: costs Memory
- Identity Scanner: costs Identity
- Group Gate: costs shared Human Charge

As Drain Intensity increases, machines demand more resources or require multiple players.

Drain Pod System

When the Warden captures a player, they are placed into a Drain Pod. The pod slowly drains their resources in this order:

- Warmth
- Voice
- Stamina
- Memory
- Identity

If the player reaches zero Identity inside the pod, they become a permanent battery and cannot escape that match. Rescuing someone from a pod costs resources. The cost increases as Drain Intensity rises.

Trust/Betrayal System

The game tracks cooperative and selfish actions.

Cooperative actions include:

- rescuing teammates
- having resource costs
- distracting the Warden
- helping low-resource players
- refusing to transfer costs to others

Betrayal actions include:

- forcing resource costs onto teammates
- closing doors behind others
- refusing shared sacrifice repeatedly
- leaving captured players behind
- activating solo escape overrides

This system affects endings, match score, and post-game results.

[SIDEQUEST] Difficulty Progression System

Difficulty increases through the Drain Intensity System. The facility becomes harder as players complete objectives. Difficulty does not increase randomly. It increases because player progress wakes the facility up.

Difficulty increases through:

- higher machine costs
- faster Warden movement
- longer terminal hacks
- faster pod drain
- room lockdowns
- lower visibility
- more cooperative requirements
- final shared-sacrifice exit

This makes the game feel like the facility is reacting to the players.

Ending System

The ending depends on escape outcome, resource loss, teamwork, betrayal, and how much Identity remains.

Ending 1: Team Escape

Most or all players cooperate, share costs, rescue each other, and escape together. Some resources are lost, but the group survives without fully sacrificing anyone.

Ending 2: Solo Escape

One player escapes while others are captured, drained, or abandoned. The escaped player survives, but the ending frames them as selfish and haunted by what they did.

Ending 3: Betrayal Escape

A player uses Emergency Override to transfer the final exit cost onto another teammate. They escape, but the sacrificed player becomes the new battery.

Ending 4: Everyone Drained

All players fail to escape before the facility reaches maximum Drain Intensity. The facility consumes everyone and resets for the next group.

Ending 5: System Shutdown

The players discover the facility's core and choose to spend a large shared sacrifice to destroy it. The escape is harder, but this is the most heroic ending.

4A. Realistic Numbers + Source References

Source Quote 1: Flee the Facility official Roblox page

Source: Roblox experience page for Flee the Facility

Quote: "RUN, HIDE, ESCAPE! Run from the beast, unlock the exits, and flee the facility!"

- Use in Battery Human: Battery Human uses the same broad escape fantasy: players run, hide, unlock escape systems, and flee a hostile facility. However, Battery Human changes the resource model by making the players themselves the battery.

URL: <https://www.roblox.com/games/893973440/Flee-the-Facility>

Source Quote 2: Roblox Players.MaxPlayers documentation

Source: Roblox Creator Documentation

Quote: "This property determines the maximum number of players that can be in a server."

- Use in Battery Human: The match size is intentionally designed as 4-6 players because the maximum server size can be configured by the developer. A smaller server supports tension, teamwork, and betrayal without becoming chaotic.

URL: <https://create.roblox.com/docs/reference/engine/classes/Players/MaxPlayers>

Source Quote 3: Flee the Facility computer objective reference

Source: Flee the Facility Wiki, Computers page

Quote: "Survivors must hack a certain number of computers (Survivor count + 1) to unlock the Exit Doors."

- Use in Battery Human: Battery Human uses this as inspiration but changes it. Instead of only hacking computers, players complete 4-6 facility objectives that cost human resources. For example, in a 5-player match, the game can require 5 objectives before the final exit phase.

URL: <https://flee-the-facility.fandom.com/wiki/Computers>

Source Quote 4: Flee the Facility exit door timing reference

Source: Flee the Facility Wiki, Exit Doors page

Quote: "It takes 12 seconds to open an Exit Door"

- Use in Battery Human: Battery Human can use 10-15 seconds as a realistic exit-opening window. This is long enough to create tension but short enough to feel fair.

URL: https://flee-the-facility.fandom.com/wiki/Exit_Doors

Source Quote 5: Roblox Robux support page

Source: Roblox Support, Ways to Get Robux

Quote: "Robux are the virtual currency of Roblox"

- Use in Battery Human: If the game is positioned as Roblox-inspired or Roblox-compatible, real-money purchases should be framed around Robux, mainly for cosmetics and non-pay-to-win items.

URL: <https://en.help.roblox.com/hc/en-us/articles/203313200-Ways-to-Get-Robux>

Source Quote 6: Roblox Monetization Passes documentation

Source: Roblox Creator Documentation, Passes

Quote: "Passes let you charge users a one-time Robux fee"

- Use in Battery Human: Game passes can be used for cosmetic bundles, private server features, or lobby effects. They should not sell gameplay power because that would damage fairness.

URL: <https://create.roblox.com/docs/production/monetization/passes>

Ideal Match Numbers

Players per match: 4-6 players

Recommended default: 5 players

Reason:

1. 4 players is enough for teamwork and rescue tension.
2. 5 players allows one player to be captured while the others continue objectives.
3. 6 players is the upper limit before voice/chat chaos becomes harder to manage.

Warden:

1. Main student-friendly version: AI-controlled Warden.
2. Future expansion: 1 player-controlled Warden mode.

Round length:

1. Early target: 8-12 minutes per match.
2. Maximum match timer: 15 minutes.
3. Sudden death / Full Consumption: begins after 12 minutes or after all objectives are complete.

Objectives:

1. 4-player match: 4 objectives + final gate.
2. 5-player match: 5 objectives + final gate.
3. 6-player match: 6 objectives + final gate.

Resource starting values per player:

1. Stamina: 100
2. Warmth: 100
3. Memory: 100
4. Voice: 100
5. Identity: 100

Basic resource costs:

1. Open small door: 5 Stamina
2. Force heavy door: 15 Stamina
3. Hack terminal: 10-15 Memory
4. Rescue from Drain Pod: 10 Warmth + 10 Stamina
5. Voice ping / call for help: 5 Voice
6. Warden distraction shout: 15 Voice
7. Emergency override: 20 Identity or transferred cost to another player
8. Final exit contribution: 20-30 Human Charge per surviving player

Drain Pod timing:

1. Phase 1: drains 5 total resource points every 10 seconds
2. Phase 2: drains 7 total resource points every 10 seconds
3. Phase 3: drains 10 total resource points every 10 seconds
4. Phase 4: drains 15 total resource points every 10 seconds

Exit gate:

1. Opening time: 10-15 seconds
2. Human Charge requirement: 100 total in normal mode
3. Hard mode requirement: 120-150 total

Difficulty scaling:

1. Phase 1 begins at match start.
2. Phase 2 begins after 2 objectives.
3. Phase 3 begins after 4 objectives or 8 minutes.
4. Phase 4 begins when the final exit phase starts or after 12 minutes.

4B. Progression, Economy + Cosmetics

Battery Human has two types of progression:

1. Match Progression: This is the gameplay progression inside one match.
2. Account Progression: This is the player's long-term progression outside matches.
3. Match Progression:
 - During each match, progression happens when players:
 1. complete facility objectives
 2. unlock new rooms
 3. rescue captured teammates
 4. activate the final exit
 5. survive increasing Drain Intensity
 6. choose cooperation or betrayal

This progression makes the match harder because every completed objective increases Drain Intensity.

- Account Progression: After each match, players earn account rewards based on performance.

Players can earn:

1. Battery Shards
 2. XP
 3. titles
 4. badges
 5. cosmetics
 6. lobby effects
 7. Warden skins
 8. survivor skins
 9. emotes
- Battery Shards: Battery Shards are the in-game soft currency.

Players earn Battery Shards by:

1. completing objectives
2. rescuing teammates
3. escaping
4. surviving until late game
5. sacrificing resources for the team
6. getting Team Escape or Facility Shutdown endings

Battery Shards can buy:

- survivor outfits

- Warden visual skins
 - trail effects
 - idle animations
 - rescue animations
 - terminal hack effects
 - nameplate styles
 - lobby poses
- Real Money/Premium Currency

If the game is Roblox-style, the real-money currency would be Robux. If it is outside Roblox, the game can use a premium currency called Power Cells. Premium purchases are cosmetic only.

Real-money purchases can include:

- skin bundles
- lobby room themes
- special emotes
- cosmetic Warden effects
- profile frames
- private server access
- battle pass / seasonal pass

Real-money purchases does NOT include:

- higher Stamina
- faster hacking
- stronger rescue abilities
- lower Drain cost
- faster escape
- gameplay advantages

This keeps the game fair. Since the main game is about sacrifice and trust, pay-to-win would ruin the emotional design.

- Seasonal Progression

The game can have seasons such as:

Season 1: Awakening Ward

Season 2: Cold Wing

Season 3: Voice Chamber

Season 4: Identity Collapse

Each season can add:

- new map variants
- new cosmetics
- new titles
- new facility announcements
- new Warden skins
- new lobby decorations

Example Cosmetics

Survivor skins:

- Test Subject Uniform
- Torn Lab Coat
- Cold Wing Survivor
- Static Memory Outfit
- Identity Glitch Suit

Warden skins:

- Default Warden
- Rusted Warden
- Hospital Warden
- Neon Core Warden
- Broken Prototype Warden

Titles:

- "Human Battery"
- "Pod Survivor"
- "Final Charge"
- "The One Who Paid"
- "Facility Error"
- "Team Savior"
- "Traitor"

Cosmetic design supports replayability without affecting gameplay balance.

4C. Reference Images

Reference Image 1: Flee the Facility screenshot/thumbnaill reference

URL: <https://www.roblox.com/games/893973440/Flee-the-Facility>

Reference Image 2: Dark sci-fi corridor

Design takeaway:

Battery Human levels should use long corridors, side rooms, visible doors, and lighting that helps players understand escape routes while still feeling unsafe.

Reference source:

Getty Images/futuristic sci-fi corridor reference

Search phrase: "dark futuristic corridor science fiction facility"

Reference Image 3: Cold laboratory/research room

Design takeaway:

Early rooms should look cleaner and more clinical. As Drain Intensity rises, the facility should become darker, glitchier, and more hostile.

Reference source:

Getty Images / futuristic laboratory corridor reference

Search phrase: "futuristic laboratory corridor"

Reference Image 4: Industrial sci-fi control room

Design takeaway:

The final level should feel like a giant machine built around consuming people. The exit gate should be visually connected to pipes, cables, pods, and glowing human-energy tanks.

Reference source:

Getty Images / underground sci-fi control room reference

Search phrase: "underground central laboratory control room sci fi"

Reference Image 5: Terminal/computer objective reference

Design takeaway:

Terminals should be bright, readable, and easy to recognize from a distance. Players should instantly know what can be hacked or powered.

Flee the Facility computers reference

URL: <https://flee-the-facility.fandom.com/wiki/Computers>

5. Narrative

The story begins with several players waking up inside separate rooms of a strange research facility. They do not remember entering. Each player has a wrist device attached to them. The device displays their Human Charge levels:

- Stamina
- Warmth
- Memory
- Voice
- Identity

A calm facility announcement plays:

"Welcome, active power units."

At first, the players believe they are test subjects trying to escape. Soon, they discover something worse. They are not only trapped inside the facility. They are what keeps it alive.

The facility was built as an experimental energy system. Instead of electricity, it runs on human traits. Movement becomes power. Body heat becomes fuel. Memory becomes data. Voice becomes command input. Identity becomes system authorization.

The players find evidence that many groups came before them. Some escaped. Some became batteries. Some betrayed their teammates. Some still exist inside the walls as faint voices, corrupted records, and flickering names on old terminals.

Characters and voices in the facility say things like:

- "Power unit detected."
- "Please contribute to group survival."
- "Your teammate has entered a Drain Pod."
- "Identity loss is normal during escape."
- "Do not worry. Your sacrifice is useful."
- "The facility thanks you for your warmth."
- "One of you is enough to open the gate."
- "Human charge insufficient."
- "Emergency Override available."

As the match progresses, the facility becomes more aggressive. It realizes the players are trying to leave. The lights flicker, alarms start, rooms lock down, and machines demand more from them.

The Warden appears as the facility's physical enforcer. It captures players and returns them to the power system. It does not hate the players. It treats them like equipment. The story is about exploitation, survival, teamwork, betrayal, and the fear of becoming useful only when consumed.

The main narrative question is: If escape requires sacrifice, does survival still count as victory?

6. Levels

Level 1: Awakening Ward

The players wake up in separate rooms and learn basic controls.

Purpose: Introduce movement, interaction, Human Charge meters, and the idea that doors require human resources.

Gameplay:

- Players open small doors using Stamina.
- Players see their wrist devices for the first time.
- Players hear the facility call them "power units."
- Players reunite in the first shared room.

Difficulty: Low

The facility is quiet and only beginning to wake up.

Level 2: Terminal Hall

Players discover the first Memory Terminals.

Purpose: Introduce hacking, Memory cost, objective completion, and the first increase in Drain Intensity.

Gameplay:

- Players must hack terminals to unlock the next zone.
- Failed hacks create noise.
- The Warden is heard but not fully revealed at first.
- Players learn that progress increases danger.

Difficulty: Low to Medium

The Warden begins patrolling after objectives are completed.

Level 3: Cold Wing

Players enter a freezing section of the facility where Warmth drains over time.

Purpose: Introduce environmental resource drain and teammate support.

Gameplay:

- Staying too long reduces Warmth.
- Players can share Warmth to stabilize teammates.
- Frozen doors require Warmth to open.
- The first Drain Pods appear.

Difficulty: Medium

Players must move faster and decide whether to rescue drained teammates.

Level 4: Voice Chamber

Players enter a dark sound-sensitive area.

Purpose: Introduce Voice as a resource and create stealth tension.

Gameplay:

- Players use Voice to activate doors and call for help.
- Loud actions attract the Warden.
- Low Voice makes communication harder.
- Captured players with low Voice cannot call clearly for rescue.

Difficulty: Medium to High

The Warden reacts more strongly to sound.

Level 5: Identity Processing Unit

Players reach the facility's central recognition system.

Purpose: Introduce Identity cost, Emergency Override, and betrayal options.

Gameplay:

- Identity scanners block progress.
- Players can pay Identity to bypass gates.
- Emergency Overrides allow players to transfer costs to teammates.
- The facility tempts players with faster escape routes.

Difficulty: High

Team trust becomes unstable. The Warden becomes faster and more aggressive.

Level 6: Take Your Turn

The players reach the final escape gate.

Purpose: Final test of teamwork, sacrifice, and survival.

Gameplay:

- The exit requires a large shared Human Charge payment.
- Low-resource players struggle to survive.
- Rescue pods drain extremely fast.
- The Warden patrols near the exit.
- Players can cooperate, betray, or sacrifice themselves.

Difficulty: Very High

The facility reaches Full Consumption. The final question is not only whether players can escape, but who pays the cost.

The game does not ask: "Can you find enough resources?"

It asks: "Who becomes the resource?"

7. UI / UX

The UI should look official, clean, and slightly oppressive.

Main Screen

The UI should look clinical, cold, digital, and slightly inhuman. It should feel like the facility sees players as power units instead of people.

The screen shows:

- player character
- nearby teammates
- Warden danger indicator
- interactable machines
- Human Charge meters
- current objective
- Drain Intensity phase
- captured teammate alerts
- exit gate progress
- emergency override warnings

The Human Charge display should be the most important UI element. It should show:

Stamina

Warmth

Memory

Voice

Identity

Each meter should have a clear visual effect when low.

Example:

Stamina low: movement icon shakes

Warmth low: blue frost effect spreads on UI

Memory low: objective text glitches

Voice low: communication icon fades

Identity low: player name corrupts

Choice UI

Choices should feel like survival decisions, not normal menu options.

Example:

A. Spend 15 Stamina to open the door.

Safe, physical, tiring.

B. Spend 10 Memory to hack the lock.

Slower, quieter, mentally costly.

C. Call a teammate for help.

Uses Voice, may attract Warden.

D. Use Emergency Override.

Fast, dangerous, may drain someone else.

E. Leave and search for another route.

Safer, but wastes time and increases pressure.

As Drain Intensity rises, choices become more expensive and more morally difficult.

Feedback Design

When Stamina decreases:

- player animation becomes slower
- breathing becomes heavier
- sprint meter shakes
- footsteps drag

When Warmth decreases:

- screen becomes colder
- frost appears around the edges
- heartbeat slows
- hands tremble during interactions

When Memory decreases:

- text glitches
- map details disappear
- terminal prompts become confusing
- some room names vanish

When Voice decreases:

- player calls become distorted
- ping range becomes shorter
- teammate alerts become weaker
- dialogue options become silent symbols

When Identity decreases:

- player name corrupts
- face/sprite loses detail
- UI refers to player as "Unit" instead of name
- facility doors stop recognizing them as human

When Drain Intensity increases:

- alarm lights activate
- machine hum becomes louder
- Warden music intensifies
- doors slam shut
- objective costs increase on screen
- facility announcements become more threatening

Announcement Screen

The facility announcement screen should be a major visual element. It should display cold, official messages.

Examples:

Drain Intensity: LOW

Power Units Active: 5

Human Charge Required: 40

Pod Occupied: Player 3

Identity Loss Detected

Emergency Override Available

Exit Gate Charging: 65%

The UI should constantly remind players that the facility does not see them as people.

Main Menu Design

The main menu should look like a facility login screen rather than a normal horror menu.

Main menu elements:

- Battery Human logo
- flickering facility background
- Play button
- Lobby button
- Cosmetics button
- Shop button
- Settings button
- Credits button
- Exit button

Visual style:

- dark background
- cold blue/green monitor glow
- red warning accents
- glitching text
- low machine hum
- random facility announcements

Example main menu text:
"POWER UNIT DETECTED"
"BEGIN EXTRACTION?"
"HUMAN CHARGE: UNKNOWN"

Lobby Design

The lobby is where players wait before a match. It should look like a containment waiting room.

Lobby elements:

- player avatars standing in glass test chambers
- ready/unready buttons
- party list
- map vote screen
- difficulty vote
- cosmetics preview
- countdown timer
- chat/ping area
- role hint panel
- tutorial button

The lobby should already communicate the theme. Players are not heroes preparing for battle. They are test subjects being sorted into a facility.

Matchmaking Flow

1. Player opens game.
2. Player enters lobby.
3. Player joins public match or private party.
4. Players vote on map.
5. Players vote on difficulty.
6. Players ready up.
7. Facility loading screen appears.
8. Players wake up in separate rooms.

Loading Screen Design

The loading screen should display fake facility files.

Examples:

"Subject group approved."

"Human Charge calibration in progress."

"Memory systems unstable."

"Identity extraction authorized."

"Do not damage power units before use."

In-Game HUD Design

The in-game HUD should be readable during chases. It should not cover too much of the screen.

HUD layout:

Top center:

- current objective
- number of objectives completed
- Drain Intensity phase

Top right:

- teammate status icons
- captured/downed/free indicators

Bottom left:

- Stamina and Warmth meters

Bottom right:

- Memory, Voice, and Identity meters

Center:

- interaction prompts
- Warden danger warnings
- emergency override prompts

Map / Objective UI

The map should be limited, not a full easy map. It becomes less reliable if Memory is low.

High Memory:

- shows rooms
- shows objectives
- shows teammate pings

Medium Memory:

- shows only nearby rooms
- objective names glitch

Low Memory:

- rooms disappear
- pings become delayed
- map labels become corrupted

Shop UI

The shop should be cosmetic and non-pay-to-win.

Shop tabs:

- Survivor Skins
- Warden Skins
- Emotes
- Nameplates
- Lobby Effects
- Seasonal Items
- Game Passes

Each item should clearly say: "Cosmetic only. No gameplay advantage."

Post-Match Results UI

After the match, players see:

- ending achieved
- who escaped
- who became a battery

- resources sacrificed
- teammates rescued
- betrayal actions
- Battery Shards earned
- XP earned
- unlocked cosmetics/titles

Post-match screen example:

ENDING: TEAM ESCAPE

Facility Status: Active

Players Escaped: 4/5

Human Batteries Created: 1

Team Trust: 72%

Battery Shards Earned: 145

7A. Sound Design

The sound design should make the facility feel alive, hungry, and mechanical.

Sound Goals

1. Make players feel hunted.
2. Make resource loss feel physical.
3. Make Drain Intensity clearly noticeable.
4. Make teamwork and betrayal emotionally dramatic.
5. Make the facility feel like it is feeding on people.

Core Ambience

The facility should always have background sounds:

- low electrical hum
- distant metal creaks
- ventilation fans
- muffled alarms
- fluorescent light buzz
- faraway footsteps
- machines breathing like lungs

The ambience should become louder and more distorted as Drain Intensity increases.

Warden Sound

Warden sounds:

- heavy mechanical footsteps
- distorted breathing
- metal dragging
- low warning tone
- sudden chase sting
- pod activation sound after capture

The Warden should be scary, but not silent-unfair. Players need audio warnings to make chase gameplay feel skill-based.

Resource Sound Feedback

Stamina:

- heavy breathing
- heartbeat
- footstep drag
- exhaustion gasp

Warmth:

- shivering
- heartbeat slowing
- icy crackle
- muffled breathing

Memory:

- reversed whispers
- glitch sounds
- broken radio noise
- missing-word audio cuts

Voice:

- static in communication
- distorted calls
- echoing cough
- failed ping beep

Identity:

- name announcement glitch
- deep system error tone
- voice duplication

- human sound fading into machine sound

Drain Intensity Audio Progression

Phase 1: Low Drain

- quiet hum
- soft monitor beeps
- distant machinery

Phase 2: Rising Drain

- stronger machine hum
- more frequent announcements
- Warden footsteps become clearer

Phase 3: Emergency Lockdown

- alarm pulses
- doors slam
- lights buzz
- music becomes faster

Phase 4: Full Consumption

- loud facility heartbeat
- distorted announcements
- constant low chase tension
- exit gate energy surge

Music Style

Music should be minimal and atmospheric, not too melodic.

Suggested style:

- dark ambient pads
- low percussion
- glitch sounds
- industrial hits
- heartbeat rhythm
- rising strings during final escape

Important Sound Moments

Terminal completed:

- short electronic success sound mixed with a painful memory-drain glitch

Teammate captured:

- loud pod slam
- muffled scream
- facility announcement

Emergency override used:

- sharp warning tone
- teammate damage sound
- betrayal notification

Final gate opens:

- huge power surge
- heartbeat stops for one second
- escape alarm begins

Sound should constantly remind players that the facility is not simply a building. It is a machine that feeds.

7B. Level Design Requirements

This section explains what kind of level design Battery Human requires from a gameplay perspective.

Level Design Goal

Each level must support:

- hiding
- chasing
- rescuing
- resource spending
- cooperative objectives
- betrayal opportunities
- multiple escape routes
- increasing difficulty

The level should not just look like a facility. It should create gameplay situations where players must decide who spends resources and who takes risks.

Map Structure

Each map should include:

1. Spawn Rooms

Players begin separated so they must find each other.

2. Central Hub

A main area that connects multiple wings.

3. Objective Rooms

Rooms containing terminals, generators, voice locks, or identity scanners.

4. Chase Corridors

Longer paths where the Warden can chase players.

5. Looping Routes

Circular paths that let skilled players escape without getting trapped instantly.

6. Vent / Crawl Routes

Small routes that survivors can use but the Warden cannot use as easily.

7. Dead-End Reward Rooms

Risky rooms with useful objectives or safe stations but limited escape routes.

8. Drain Pod Rooms

Capture zones where rescued players can be recovered.

9. Safe Rooms

Temporary safety spaces that cost Warmth or Stamina to activate.

10. Final Gate Area

A high-risk zone where the last sacrifice happens.

Gameplay Layout Rules

1. Every objective room needs at least two exits.
This prevents unfair Warden camping.
2. Drain Pods should not be too close to the final gate.
This prevents instant capture-loss loops.
3. The map should have strong landmarks.
Players need to remember locations even when Memory is low.
4. There should be high-risk shortcuts.
Shortcuts can save time but cost resources or expose players.
5. The Warden should have patrol routes and pressure zones.
The Warden should feel dangerous but not random.
6. Resource machines should be placed to create decisions.
For example, a Warmth station should be near a cold area but slightly risky to reach.
7. The final gate should be open enough for tension.
Players need space to dodge, hide, and argue over final sacrifice.

Level Design and Resource Types

Stamina-based areas:

- heavy doors
- broken lifts
- barricades
- long chase corridors

Warmth-based areas:

- cold rooms
- frozen doors
- rescue stations
- temporary safe zones

Memory-based areas:

- terminals
- code rooms
- map rooms
- corrupted archives

Voice-based areas:

- voice locks
- echo chambers
- sound-sensitive halls
- call-for-help zones

Identity-based areas:

- scanners
- override rooms
- final gate
- betrayal machines

Difficulty Through Level Design

As Drain Intensity rises, the level itself changes:

Phase 1:

- most routes open
- lights stable
- machines cheap

Phase 2:

- some doors need two players
- Warden patrol expands
- terminal rooms become riskier

Phase 3:

- certain routes lock temporarily
- vents may close
- lights flicker
- rescue routes become dangerous

Phase 4:

- final gate opens
- Warden patrols exits
- emergency override machines activate
- safe rooms become expensive

This means difficulty increases through layout changes, not only enemy speed.

Example Map: Research Block A

Rooms:

- 5 spawn cells
- central hallway
- medical bay
- terminal room
- cold storage
- voice chamber
- drain pod room
- archive room
- maintenance vent route
- identity scanner gate
- final exit hall

Required objectives:

- hack 2 memory terminals
- power 1 warmth generator
- unlock 1 identity scanner
- rescue at least 1 captured player or bypass with penalty
- activate final gate

This level is small enough for a student project but complex enough for multiplayer tension.

Player Definition

The players are unnamed test subjects trapped inside a human-powered facility. They are not heroes with weapons. They are survivors whose bodies and minds are being converted into fuel. Each player begins as fully human, with complete Stamina, Warmth, Memory, Voice, and Identity. As the match continues, they lose parts of themselves depending on their choices. The player's main conflict is whether to protect themselves, help the team, or exploit others to survive.

Player Properties

Stamina: physical energy used for running, forcing doors, carrying teammates, and escaping grabs

Warmth: body heat used for survival, rescue, healing, and heat-powered machines

Memory: mental clarity used for hacking, maps, codes, and understanding the facility

Voice: communication power used for calling, distracting, pinging, and voice locks

Identity: humanity and recognition used for scanners, overrides, endings, and final escape

Trust Score: tracks cooperation and betrayal during the match

Drain Exposure: tracks how much the facility has consumed from a player

Capture Status: shows whether the player is free, downed, carried, or trapped in a Drain Pod

Player Rewards

The player does not collect coins, weapons, or normal upgrade items. Rewards are strategic, social, and survival-based.

Rewards include:

1. objective progress
2. unlocked escape routes
3. temporary safe rooms
4. rescued teammates
5. restored partial resources
6. lower Warden pressure
7. hidden facility information
8. better team trust
9. alternate escape options
10. different endings
11. cosmetic titles after matches
12. new character skins in future expansion

The main reward is not becoming stronger. The main reward is surviving without losing too much of yourself.

Winning and Losing

Winning

The players win by escaping the facility before the Drain Intensity reaches maximum consumption. The best win condition is a Team Escape, where most or all players cooperate, share costs, rescue each other, and escape without fully sacrificing anyone. A stronger victory is the Facility Shutdown ending, where players discover the facility core and destroy it through a difficult shared sacrifice.

Losing

Players lose if:

- all players are captured
- all players lose Identity
- the facility reaches Full Consumption and no one escapes
- the final gate is not activated in time
- players betray each other so badly that the team collapses

A player can also personally lose even if another player escapes. For example, one player may become the Human Battery while another uses them to open the exit. A losing ending should still feel meaningful because it shows the cost of selfishness, panic, or failed cooperation.

Why Is This Fun?

Battery Human is fun because it turns a familiar multiplayer escape format into a tense resource-based social horror game.

Players enjoy:

- running from the Warden
- hiding in facility rooms
- activating terminals and machines
- rescuing captured teammates
- negotiating who pays resource costs
- choosing whether to cooperate or betray
- seeing the facility get harder over time
- experiencing different endings
- replaying matches with different teams and strategies
- creating chaotic multiplayer moments

The game is exciting because players are never only asking, "How do we escape?" They are also asking: "Who pays for the escape?"

The multiplayer design makes every match different. A helpful team may create a heroic escape story. A selfish team may turn the game into betrayal horror. A brave player may sacrifice themselves. A panicked player may abandon everyone. A clever player may save resources until the perfect moment.

The increasing difficulty keeps the game tense. The facility starts manageable, but every completed objective makes it more dangerous. The Warden becomes stronger, machines become more expensive, rescue becomes harder, and the final gate forces a major decision.

The game uses horror, teamwork, betrayal, resource management, and social pressure to make the prompt “The Player Is the Resource” feel direct and playable.

My One-Line Pitch

A multiplayer facility escape horror game where players must survive a machine that does not need batteries because it uses them instead.
